QUESTION 1

The database containing the Content Store crashed. The administrator needs to restore the Content Store in its entirety including all of the configuration settings that were defined.

What must be done to recover the configuration settings?

- A. The configuration settings are automatically included when running the import.
- B. Manually apply the settings because configuration settings are not a part of the Content Store deployment.
- C. Configuration settings are not included in the Content Store deployment. The parameter `CM.DEPLOYMENTINCLUDECONFIGURATION` must be set to true on the `ContentManagerService` prior to running the Content Store export deployment.
- D. Configuration settings are included in the Content Store deployment but not included in the import unless you set the parameter `CM.DEPLOYMENTINCLUDECONFIGURATION` to true on the `ContentManagerService` before running the import.

Correct Answer: C

Specify if Configuration Objects and Children are Part of Deployment.

You can specify if configuration objects and their children are included as part of deployment. By default, they are not included.

You can change the default setting using the advanced setting

`CM.DEPLOYMENTINCLUDECONFIGURATION`.

By default, it is set to False (do not include configuration objects in deployments).

To change the default to include configuration objects and their children, set it to True.

QUESTION 2

What is the role of Cognos Access Manager (CAM)?

- A. To serve as the relational database that stores user data.
- B. To implement authentication, authorization, and encryption.
- C. To start all services that have been enabled and configured.
- D. To route requests from the gateway to local services for execution.

Correct Answer: B

Access Manager provides a centralized environment to define, store, and maintain security information for IBM Cognos business information applications. In one central location, you can set up and maintain secure user access to data, such

as cubes and reports, that are created in other IBM Cognos applications. With Access Manager, you can also set up and maintain user signon information and auto-access privileges for the data sources and servers that contain the required data.

QUESTION 3

An administrator deleted a group inadvertently then recreated it, but now the access permissions based on that group no longer work.

What must be done?

- A. Re-implement all the access permissions.
- B. On the group properties, select "Apply to all children".
- C. Make sure that it has the exact same spelling as before.
- D. Restore from a backup selecting only the access permissions.

Correct Answer: D

Incorrect Answers:

C: When you delete a Cognos group or role, access permissions based on it are also deleted. You cannot restore them by creating a new group or role with the same name because this entry has a different internal ID.

QUESTION 4

An administrator created a Content Store export and included the user account information.

How can a listing of the content be exported?

- A. Within the export, ensure the Recording level option is set to Trace.
- B. By default when the Content Store is backed up, a full detailed listing is generated and available in the Logs folder.
- C. Modify the Advanced settings on the ContentManagerService by adding the parameter CM.DeploymentDetailEntireContent with a value of true.
- D. Modify the Advanced settings on the ContentManagerService by adding the parameter CM.DeploymentIncludeConfiguration with a value of true.

Correct Answer: D

You can specify if configuration objects and their children are included as part of deployment. By default, they are not included.

You can change the default setting using the advanced setting

CM.DEPLOYMENTINCLUDECONFIGURATION.

By default, it is set to False (do not include configuration objects in deployments).

To change the default to include configuration objects and their children, set it to True.

Incorrect Answers:

C: The CM.DeploymentDetailEntireContent setting affects deployment history. By default, the information saved in deployment records includes the progress and summary reports only. If you want to include more detailed information, change the recording level using the advanced setting CM.DEPLOYMENTDETAILENTIRECONTENT.

QUESTION 5

Why would an administrator use IPF (Indication Processing Facility) logging?

- A. As a wrapper tool for gateway related errors.
- B. To process the audit logging data and write it to the audit database.
- C. As a wrapper for log4j to configure what information is written to log files.
- D. For tracing performance and communication between XQE and the BIBus.

Correct Answer: C

Some error messages may contain sensitive information, such as server names. By default, error message details in IBM Cognos software are routed to IPF log files, and the secure error message option is enabled. The information presented to users indicates only the occurrence of an error, without any details.
